Introduction

Biofuel research has become more common in the last few years as concerns about dependency on oil and fossil fuels have increased. There are more cars on the road, there is a higher demand for energy from industries, and fossil fuels are a non-renewable resource. Many industries would like to use a renewable form of fuel to power their processes. Biofuels can meet this need. Biofuels are any source of fuel or energy that is produced from organic matter, or combustible oils produced by plants or animals.

This directory lists the businesses in Georgia that use biofuels. There are 77 businesses listed in the Georgia Biofuel Directory. The businesses were contacted by telephone and asked a series of questions about their specific biofuel usage. The businesses selected for the Georgia Biofuel Directory were contacted either because they had wood burning equipment listed in the Wood Marketing and Utilization publication put out by the Georgia Forestry Commission, they released information to the press about their biofuel usage, or because information was available from industries about others burning biofuels in Georgia.

For the purpose of organization, the Georgia Biofuel Directory was organized alphabetically by county. Calculations assume that there are 24 hours in one day and 300 working days in one year. Quantities listed are estimated averages. These numbers tend to be smaller in the summer and larger in the winter as a result of energy demands. The biofuels listed in the Georgia Biofuel Directory are fuels that are most commonly used by Georgia industries. These include sawdust, shavings, tree chips, and other biofuels. The category described as “Other Biofuels” is the placeholder for biofuels such as black liquor, peanut hulls, ethanol, methanol, etc. These biofuels are used by Georgia businesses and industries but they are not used as widely.

Please contact the UGA Engineering Outreach Service if your business:

- Is interested in using biofuels
- Would like to learn more about biofuels
- Would like to update information in the Georgia Biofuel Directory
- Would like to be added to the Georgia Biofuel Directory
- Would like information on generators
-

Biofuels

Biofuels are any source of fuel or energy that is produced from organic matter, or combustible oils produced by plants or animals. Examples of products used to make biofuels include alcohol (from fermented sugar), black liquor from the paper manufacturing process, wood and rendered animals fats. The definition can be expanded to include municipal solid waste and many industrial wastes. Biofuels are created from renewable resources that can be replaced within five years.

Biofuel Use in Georgia

Biofuels are used to create energy. In Georgia that energy is usually in the form of steam or heat. Many industries in Georgia generate biofuels from their manufacturing processes. They in turn use these biofuels to fuel other processes. The Georgia Biofuel Directory was completed in May 2003. As of that date, 8.4 million tons of biofuels, from the contacted industries, were used in this way (Table 1.0). The highest biofuel usage, close to 5 million tons per year, from businesses that self generate was listed in the "Other Biofuels" category. This was primarily due to black liquor. Black liquor is a liquid by-product of the pulping process at paper mills and is an adequate source of fuel. Black liquor is quantified in gallons and for the Biofuel Directory the average density of back liquor was assumed to be 11.83 lbs/gal¹ so that the quantities could be expressed in tons.

Table 1.0 Industries Contacted in Georgia that Burn Self-Generated Biofuels as of May 2003

Biofuel	Tons/yr	Btu/lb
Tree Chips	42,000	4,300
Sawdust	1,501,042	4,500 - 7,800
Shavings	1,259,384	7,800
Bark	643,961	8,000 - 9,000
Hogged fuel	120,022	6,500
Cutoffs	12,851	4,000
Black Liquor	4,801,300	6,000
Other biofuels	302,000	4,000-6,000
Total	9,790,260	

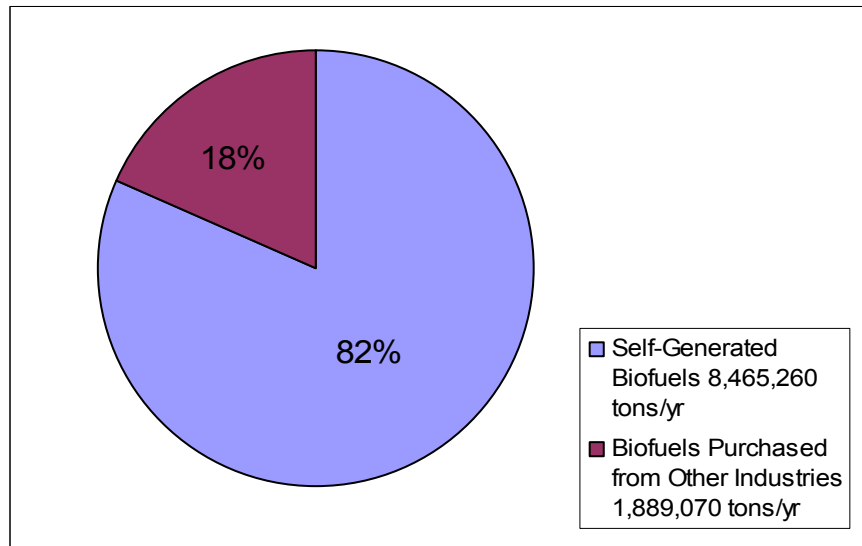

* Hogged fuel is wood waste that has been chipped or "hogged" into 1" - 7" pieces.

** Cutoffs are the wood waste created form the process of making dimensional lumber.

¹ Adams, T.N., et.al., Kraft Recovery Boilers, Tappi Press, Atlanta, GA. December 1997, pp. 88

Businesses that generate and use their own biofuels represent 82% of the total amount of biofuels used annually in Georgia. Only 18% of the biofuels used are purchased from an outside source (Chart 1.0). A total of 1.9 million tons of biofuels are purchased each year from outside sources (Table 2.0). The high cost of disposal and transportation has forced businesses to become creative and use alternative fuels as a way to generate energy and avoid these high disposal costs. This is why 82% of the biofuels used in Georgia are self-generated and used internally.

Chart 1.0 Biofuel Use from Contacted Industries in Georgia: Comparing the Amount of Self-Generated Biofuel with Biofuel Purchased from Outside Sources

Currently, most of the biofuels used by Georgia industries are wood by-products or wood residuals. Wood residuals are sold for profit to the agricultural industry, engineered wood products manufactures, and developers. Tree chips are used in the pulp and paper industry, shavings are used in the agricultural industry as animal bedding, and bark is sold to landscaping and mulching facilities for profit.

These wood residuals are also the best kind of fuel. Biofuels with high Btu or *heat* values are most desired by biofuel users. Sawdust and bark have the highest Btu values and cut offs have the lowest Btu value. This is due to the size of the residual. Cut offs are usually larger pieces of wood and sawdust particles are fine and combustible.

Table 2.0 Industries Contacted in Georgia that Purchase Biofuels from Other Industries as of May 2003

Biofuel	Tons/yr	Btu/lb
Tree Chips	43,250	4,300
Sawdust	102,850	4,500 - 7,800
Shavings	264,110	7,800
Bark	1,236,850	8,000 - 9,000
Hogged fuel	160,000	6,500
Cutoffs	43,000	4,000
Other biofuels	10	4,000
Total	1,850,070	

* Hogged fuel is wood waste that has been chipped or “hogged” into 1” - 7” pieces.

** Cutoffs are the wood waste created from the process of making dimensional lumber.

Wood residuals like; cut offs, hogged wood and sawdust are more difficult to utilize. Cut offs, the pieces removed from dimensional lumber, require further processing to be used as fuel. Sawdust is difficult to use as fuel because it requires heavy air flow and is difficult to separate, handle and control. Hogged wood is waste wood that is ground up into pieces of 1 to 7 inches. Wood cutting operations utilize equipment to hogg the branches, leaves, limbs, and stumps of trees they have felled, this is called hogged wood. This wood can be used as fuel but requires transportation from the forested area to a facility that burns the hogged wood as fuel.

As of 1998 there were 23 million tons of wood by-products generated in Georgia². All but 1.6 million tons were utilized in some way. Pulp and paper mills have been the largest generators of wood residual and by-products. Some of these mills have closed and in effect reduced the amount of wood used and the amount of residuals generated. Because of this, pulp wood sold to the paper mills, generated through annual tree thinning, has a reduced market value.
